

Róng Kít - Setup Mac OS X

Installation

The system files contained in the package need to be placed in the *Library* folder within your personal (home, user) folder in OS X. In case you can't find a folder so named, you have to make it visible first. Open the application *Terminal* (in *Applications/Utilities*) and paste the following command:

```
chflags hidden ~/Library
```

Hit *Enter*, then close the Terminal.

Return to your user folder and open *Library*.

Open the folder *Fonts* and place the font files into that folder.

Close folder *Fonts* and open folder *Keyboard Layouts*.

Place the file *Rong - Lepcha.bundle* into that folder.

Close folders and restart your Mac.

Activation

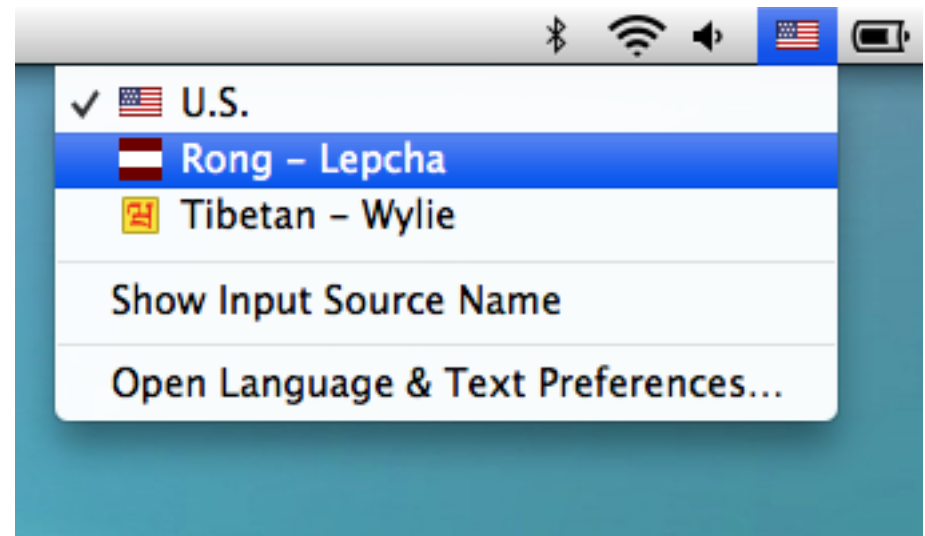

Open *System Preferences* in the *Apple Menu*.

Open *Language & Text*, click the tab *Input Sources*.

Scroll down to the entry *Rong - Lepcha* and place a tick.

Place another tick at *Show input menu in menu bar*.

Close *System Preferences*.

Select the new keyboard layout from the menu. Switch back when finished.

Note: *Rong - Lepcha* only provides text input. System-wide shortcuts such as CMD + C for copy or CMD + P for print are not supported. For these commands, the menu of the respective text editor must be used while *Rong - Lepcha* is active.
